

TIPS TO IMPROVE YOUR ONLINE POKER EXPERIENCE

POSTED ON 04 NOV, 2010

You don't need all that much equipment to play online poker. A computer, a monitor, an internet connection. But in this wondrous technological age there's no need to be a Luddite and limit yourself to the bare essentials. There are all sorts of devices and programs and gizmos that can make your time at the virtual tables more enjoyable—and more profitable.

First of all...get yourself a comfortable chair. You don't want to spend six hours winning a big tournament and then limp around like Quasimodo as you celebrate because your spine was pretzeled by a crappy chair. If you play a lot online you might even want to consider setting up a standing desk—[studies have shown that people who spend more than six hours a day sitting down](#) have a higher rate of early death, from all causes, even if they exercise and maintain a healthy weight. So if you plan on putting in a lot of hours, standing might be the way to go.

Now that I've added years to your life I want to help save your eyesight for your autumn years. If you're a serious multi-tabler you might want to invest in a second monitor. That was you won't be squinting at postage-stamp-sized tables while you try to decide if you were dealt pocket Aces or pocket Fours (there's a difference). You could also wire your computer up to your Hi-Def flatscreen and use your massive TV as your monitor, in which case you'd need a wireless mouse, which are inexpensive, readily available, and very satisfying to whip against the wall when you get two-outed on the river.

The ideal setup would be something like this...

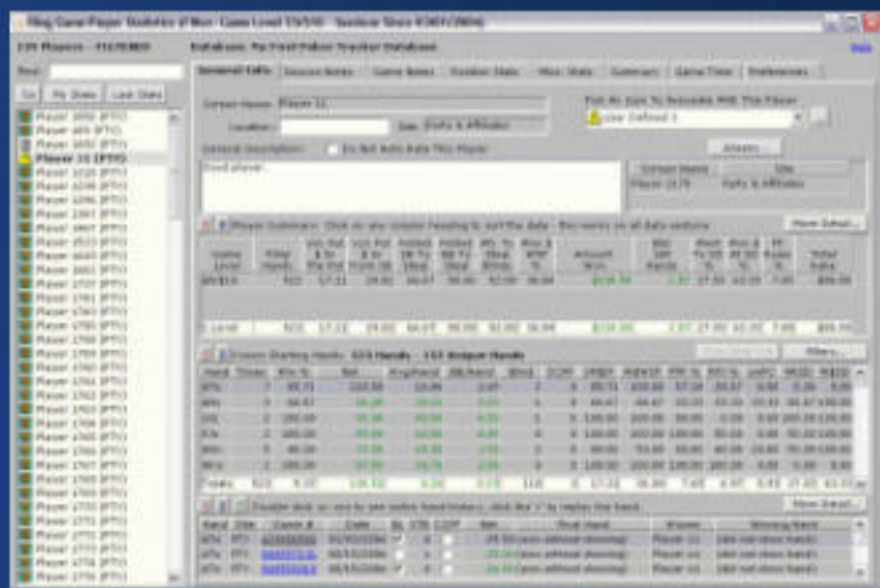

...though if that's too ambitious, you would at least want to upgrade from this:

So you're comfortable and you can see every table you have opened. Now you need to start stacking donks, felting chumps, making the monies. Such amusing colloquialisms aside, you'd rather win than lose, and there are tools you can use to help make that happen. One of the best is the heads-up display (or HUD), which gathers information from your hand histories, sorts and sifts and crunches the data, and then projects this data—including info about your opponents—onto the screen. Knowing exactly how often your opponents voluntarily put money in the pot, how often they raise as opposed to calling, how often they fold on the river, can make a huge difference in your win rate.

There are also programs that take your hand history data and crunch it into spreadsheets that allow you to analyze your play from just about any conceivable angle. Want to see if you're playing suited connectors in middle position too often? Overplaying Ace-King a bit? Not being aggressive enough when you're in position. These powerful programs can track your play over a period of years and show you, in numbers that don't lie, exactly what your results are in every possible situation. And closing up the holes in your game (and understanding what your strengths are) will make you a much, much stronger player.

What about the program software, does this go deep into your computer changing the wmi process??

What about tcp connection hackers maliciously changing software code after the access has been granted to the sub -system.?

How about when you connect to ap servers ,whatever cookie files,flashware or or programic data intervenes and you get even more tcp blocked connections come in?

Tell me why the software is not detailed in analytic code mode for the users to fully comprehend so that we as a customer dont get cheated.

Does the libsys library contain all the nessasary log files for the program, ?Where can I get the real knowledge that my absolute poker software is the real thing and not some virus malware offcut produced by a 3rd party with intent on being able to cheat .

Are your software and coded tools within granted permissions and checked periodically by microsoft and the software validated for authenticity as it is possible for the certificate of the software can be changed and modified by a 3rd party.

Does the company ensure the ssl connection is safe as ,I found that it is still running a tls connection.?

Who do I contact in regards to having my hand histories looked at without having to fork out £7,000 .?

And lastly ,You speak of avg,norton ,kaspersky etc etc but what if you overode these certain anti-virus programs as I am sure you know It is very possible to achieve given the right tools and knowledge.

have a nice day .xx DOC31
